

where have all the cowboys gone?

assessing talent flows between Canadian cities

Greg Spencer & Tara Vinodrai

Program on Globalization and Regional Innovation Systems Munk Centre for International Studies University of Toronto

| include include include include |
|---------------------------------|
|---------------------------------|

background

- quantitative analysis using city-region/cluster database to address key research questions related to themes I and II
 - innovation and economic performance of city-regions
 - employment growth
 - patenting
 - income, productivity (?)
 - inequality
 - talent attraction / retention
 - mobility flows
 - growth of highly educated / creative workforce

| | overview | talent | method | mobility | flows | next steps |
|--|----------|--------|--------|----------|-------|------------|
|--|----------|--------|--------|----------|-------|------------|

outline

- the attraction and retention of highly educated / creative workers ('talent')
- data and methods
 - city-region level data, occupational approach
 - mobility matrices (in-flows, out-flows, net flows)
 - quantitative analysis (descriptive statistics, regression)
- *preliminary* analysis of talent flows between Canadian city-regions
 - are highly educated / creative workers more mobile?
 - what are the overall patterns of labour mobility / talent flows between Canadian city-regions?
 - what quality of place characteristics are important in determining mobility patterns?
 - do these vary between different occupational categories?
- identify next steps and future directions

attracting and retaining talent

- regional economic development through attracting and retaining highly educated / creative workers (Florida 2002)
 - attracted to places with high levels of diversity, openness and tolerance, and other quality of place characteristics
- labour market mobility of highly skilled workers ('talent') and innovation
 - movement between firms, regions results in transfer of practices and ideas
 - "[workers] act as individual technology-transfer agents, moving ideas and techniques from firm to firm." (Christopherson 2002: 17)
 - 'brain circulation' facilitates building of networks / 'pipelines' between places (Saxenian 2006)
- differences between occupations in terms of quality of place characteristics that are important, politics, etc. (Markusen 2006)

attracting and retaining talent

- literature suggests a complex picture of mobility flows
 - distinctive and highly uneven geography
 - differences between domestic and international flows of talent
 - shaped by specific occupationally-based labour markets and industry dynamics, as well as individual characteristics / circumstances (e.g. age, gender, qualifications, etc.)
- scarce evidence that documents actual flows of talent between places leaves some unanswered questions:
 - are creative / talented workers more mobile than other workers?
 - what are their patterns of mobility?
 - what differences exist between different occupational groups?
 - what aspects of quality of place are important in determining mobility?

attracting talent: level of analysis

- what place characteristics / dimensions of quality of place are important in attracting / retaining talent?
 - economic & social characteristics of the region
 - income, cost of living, levels of inequality
 - economic diversity
 - social/cultural diversity, openness/tolerance
 - public provision
 - investment in local / regional innovation system
 - investment in local arts and culture scene
 - career opportunity / local career 'buzz'
 - critical mass of people in same occupation
 - diversity of work opportunities
- how do we operationalize this?

attracting talent: methods

- what determines the mobility (M) of workers in a particular occupation (*o*) between two cities/places, *i* and *j*?
 - $M_{ijo} = f$ (characteristics_i, characteristics_j, characteristics_(i-j))
 - -i = origin, j = destination, o = occupation
- can measure flows in a number of different ways
 - in-flows, out-flows, net flows
 - domestic, international
- analysis of net domestic flows
 - descriptive statistics, network analysis
 - regression analysis
 - backwards, step-wise regression: 'Florida' measures, innovation system, economic indicators, diversity/variety
 - what variables best explain mobility patterns (by occupation)?

attracting talent: level of analysis and data sources

- mobility flows and place characteristics of destination
 - geography (140 city-regions)
 - 27 Census Metropolitan Areas (CMAs, urban core ≥ 100,000)
 - 113 Census Agglomerations (CAs, urban core ≥ 10,000)
 - occupations (50 occupations)
 - 2001 National Occupational Classification Statistics (NOC-S)
 - measured at the 2-digit level
 - mobility flows by occupation
 - net domestic migration
 - note: does not consider international flows
- data sources for explanatory variables
 - Census of Population, 2001
 - US Patent and Trademark Office, 2000-2003

attracting talent: explanatory variables

- economic & social characteristics
 - employment growth (1996-2001)
 - unemployment rate
 - regional average annual income
 - affordability / cost of living
 - average rent, % households spending more than 30% of income on housing
 - economic diversity
 - industry, occupation, field of study
 - educational attainment
 - % post-secondary or higher, % university degree or higher
 - social diversity, openness / tolerance
 - % foreign-born, % persons in same-sex couples
 - diversity of place of birth, mother tongue, religion, self-reported ethnicity

attracting talent: explanatory variables

- quality of / investment in innovation system
 - patents, presence of university, PhDs per 1000
 - (university enrollments, private R&D, tri-council funding, NRC institute funding)
- quality of / investment in local arts/cultural scene
 - artists per 1000 population
 - (arts council granting, creative/cultural activity)
- career 'buzz' / opportunity
 - number of people in same occupation (critical mass)
 - international in-migrants in same occupation (global talent flow)
- note: since we are dealing with aggregate flows (i.e., not individuals), unable to account for gender, age, and family structure

overview talent method mobility flows next steps

attracting talent: measuring diversity

- diversity is measured as 'numbers equivalent' (NE) entropy for each city-region j (Beckstead and Brown 2003)
 - accounts for the number of groups (e.g. industries, occupations, etc.) and the distribution of employment between these groups

$$NE_{j} = \exp\left[\sum_{s_{ij}} \ln\left(\frac{1}{s_{ij}}\right)\right]$$

- where s_{ij} = share of employment in each group *i*
- NE is interpreted as the number of groups that would be present in a region if employment were evenly distributed across all groups
 - ranges from 1 to N (max. possible number of groups)

|----------|--------|--------|----------|-------|------------|

key questions

- are highly educated / creative workers more mobile than other workers?
- what are the patterns of mobility of highly educated / creative workers?
- what are the key place characteristics / determinants that explain the mobility of highly educated / creative workers?
- in relation to all of these questions, what differences exist between different occupational groups?

| | overview | talent | method | mobility | flows | next steps |
|--|----------|--------|--------|----------|-------|------------|
|--|----------|--------|--------|----------|-------|------------|

flows of talent: 'creative' workers are more mobile

flows of talent: % in-migration by occupation - top 10

| Occupations (3-digit NOCS) | Domestic | Int'l | Total |
|---|----------|-------|-------|
| Managers in protective service | 44.1 | 2.5 | 46.6 |
| Other occupations in protective service | 35.5 | 1.1 | 36.6 |
| Other engineers | 24.5 | 10.3 | 34.8 |
| Transportation officers and controllers | 31.8 | 2.6 | 34.4 |
| Computer and information systems professionals | 22.9 | 11.2 | 34.1 |
| University professors and assistants | 20.9 | 13.1 | 34.0 |
| Mine service workers / oil & gas drilling operators | 32.7 | 0.7 | 33.4 |
| Life science professionals | 28.5 | 4.7 | 33.2 |
| Physical science professionals | 23.4 | 9.7 | 33.1 |
| Civil, mechanical, electrical & chemical engineers | 23.3 | 8.8 | 32.2 |

flows of talent: % in-migration by occupation - bottom 10

| Occupations (3-digit NOCS) | Domestic | Int'l | Total |
|--|----------|-------|-------|
| Agriculture and horticulture workers | 12.4 | 3.7 | 16.1 |
| Machine ops. & related in pulp & paper / wood processing | 14.3 | 1.2 | 15.5 |
| Upholsterers, tailors, shoe repairers, jewellers and related | 11.8 | 3.5 | 15.3 |
| Public works and other labourers, n.e.c. | 14.4 | 0.9 | 15.3 |
| Heavy equipment operators | 14.8 | 0.4 | 15.2 |
| Logging and forestry workers | 14.7 | 0.3 | 15.0 |
| Mail and message distribution occupations | 13.1 | 1.8 | 14.9 |
| Logging machinery operators | 12.6 | 0.2 | 12.8 |
| Contractors, supervisors in agric., hortic. & aquaculture | 7.9 | 1.2 | 9.1 |
| Other fishing and trapping occupations | 8.0 | 0.3 | 8.3 |
| Fishing vessel masters and skippers and fishermen | 7.0 | 0.2 | 7.2 |

next steps: multivariate analysis and metrics

- different measures / specification of the dependent variable
 - net flows, in-flows, out-flows
 - explore the differences between global talent flows (international in-migration) and local talent flows (domestic in-migration)
- incorporation of additional data to support ONRIS / ISRN research
 - develop additional metrics based on data currently available
 - social diversity, cohesion, and inclusion
 - how else to define / measure quality of place?
 - develop additional metrics based on new data sources
 - investments in the regional innovation system
 - private R&D, university enrolments, additional patent data
 - investments / characteristics of the local arts & cultural scene
 - include recent data from the 2006 Census of Population
 - available in March 2008

| overview | talent | method | mobility | flows | next steps |
|----------|--------|--------|----------|-------|------------|
|----------|--------|--------|----------|-------|------------|

preliminary findings and open questions

- different dimensions of quality of place matter to the mobility patterns of different occupations
 - are there differences by knowledge types?
- policy emphasis on talent attraction or retention?
 - dependent on size? scale?
- what is a 'good' pattern of migration?
 - local vs. national considerations
 - competitiveness vs. inclusion / equality
